MOUNTING INSTRUCTION

## Stainless Steel Weephole Covers

**1**

Weephole Covers is a universal solution that offers perfect protection of the cavity against all kinds of vermin, with conservation of the needed cavity insulation. Furthermore, it makes the cavity look nice and seamless. These covers are easy to mount in weep holes from 5 to 25mm width.

Clean the weep hole before mounting the grill. If necessary, cut out the excess joint and cement deep enough, so there will be a nice space to fit the grill in.

**2**

Get the Weephole Cover between your fingers.

If it is a very wide weep hole you can add a thin layer of glue to the sides (for example a Fix-All) for a perfect fit.

Squeeze the ends of the Weephole Cover together and push the grill into the weep hole.

**3**

Push the Weephole Cover further into the weep hole.

Depending on the width of the weep hole, the grill may be difficult to mount. In the case of a very small weep hole, use a wooden cube and a hammer to carefully put the grill into the weep hole.

**4**

The Weephole Cover is mounted correctly when the front is equal with the cavity front. The grill will then be firmly secured in the cavity.

The result is a durable and seamlessly looking cavity, vermin are kept away without reducing ventilation.
